A thirty-five-variable consistency equation

Positive integer unknowns; exact degree 6; a 145-operation evaluator.

The only unknowns are the thirty-five separately named positive-integer variables

$$J,F,\alpha,f,g,T,X,Y,\xi,\eta,\zeta,\upsilon,\gamma,\psi,\varphi,\epsilon,$$
$$c,\ell,h,t,m,n,p,j,d,o,e,z,\delta,$$
$$\kappa,\lambda,\tau,\chi,\theta,Q\in\mathbb{Z}_{>0}.$$

All other symbols below are polynomial abbreviations:

$$b=\beta J,\quad q=1+b,\quad C=q-F-\alpha,\quad U=Y\kappa,$$
$$a=\lambda+Y,\quad s=q\kappa,\quad x=\lambda q,$$
$$\sigma=\psi^2,\quad \nu=\upsilon^2,$$
$$E=\lambda,\quad k=\eta+\zeta,\quad W=h-t,$$
$$H=3+4a,\quad \Delta=\delta,\quad L=X+ac,$$
$$M=sb,$$
$$R=[\alpha+(q-F)b](\kappa-1)+J(\mu+\omega q),$$
$$Z=p-j,\quad D=d-o,\quad V=e-z,$$
$$\vartheta=V^2,$$
$$I=\theta,$$
$$\mathcal{P}=Z^2-\sigma(1+\tau),$$
$$\mathcal{D}=D^2-\chi(1+\Delta n),$$
$$\mathcal{Q}=\nu-Q[\nu-\vartheta]-1,$$
$$\mathcal{R}=I^2-Q,$$
$$\mathcal{B}=\psi-M,\quad \mathcal{C}=\varphi-U,\quad \mathcal{G}=\epsilon-R,$$
$$\mathcal{H}=c-\eta-Yk,$$
$$\mathcal{L}=\ell-EYk,\quad \mathcal{W}=W-[C(X+Kq)-Fq],$$
$$\mathcal{Z}=m-f^2,\quad \mathcal{N}=n-c^2,$$
$$\mathcal{I}=Z-[\psi(\ell+k+\xi-kW)+Yb-Ws],$$
$$\mathcal{J}=D-[\varphi L+H(\varphi\gamma+x+\epsilon+1-k)],$$
$$\mathcal{K}=V-[m(Tc-\epsilon)-c],\quad \mathcal{O}=\delta-H-a^2,$$
$$\mathfrak{J}=\kappa-q^2,\quad \mathcal{F}=\lambda-XY,$$
$$\mathcal{S}=\tau-\ell(\ell+k),$$
$$\mathcal{U}=\chi-\varphi^2,\quad \mathcal{V}=\theta-ng,$$
$$\mathfrak{B}=Q-\Delta(m-1).$$

The single Diophantine equation is

$$\mathcal{P}^2+\mathcal{D}^2+\mathcal{Q}^2+\mathcal{R}^2+\mathcal{B}^2+\mathcal{C}^2+\mathcal{G}^2$$
$$+\mathcal{H}^2+\mathcal{L}^2+\mathcal{W}^2+\mathcal{Z}^2+\mathcal{N}^2$$
$$+\mathcal{I}^2+\mathcal{J}^2+\mathcal{K}^2+\mathcal{O}^2+\mathfrak{J}^2+\mathcal{F}^2$$
$$+\mathcal{S}^2+\mathcal{U}^2+\mathcal{V}^2+\mathfrak{B}^2=0.$$

The four fixed integers. Every index, set, sum, product and floor below defines a constant, not another unknown. Put

$$\rho=2^{47},\quad B=\rho^{2011},\quad \beta=B-1,$$
$$G_m(x)=\sum_{j=0}^{m-1}x^j,\quad \Lambda=\rho^{1005}.$$

$$\mu=\beta-G_{951}(\rho)$$
$$-\rho^{960}G_{26}(\rho)-\rho^{1004},$$
$$\omega=\beta+8G_{917}(\rho)-4+(2^{45}-4)\Lambda$$
$$+\rho^{960}G_9(\rho)+\rho^{987}G_8(\rho)+\rho^{1004},$$
$$K=\rho^{18}+\rho^{1004}+\rho^{2020}$$
$$+2\Lambda\Phi(1/\rho),$$

where

$$\chi_i=1+2^{10}(1+w_i+2^8n_i$$
$$+2^{17}p_i+2^{25}s_i)\quad(0\le i\le 941),$$
$$\pi(0)=0,\quad \pi(i)=1+\sum_{j=1}^{941}\left\lfloor\frac{2^{44}-1+\chi_j-\chi_i}{2^{44}}\right\rfloor\quad(1\le i\le 941).$$

$$\Phi(x)=\sum_{i=0}^{941}\chi_i x^{\pi(i)}$$
$$+2^{10}x^{969}(x^9+2^{17})G_8(2x)$$
$$+2^{18}x^{942}(x^{18}+2^{17})G_9(2x).$$

The rational intermediate in K cancels exactly; all four results are positive integers.

The 942 indexed fixed tiles. Use the actions u_j,v_j,d_j decoded below. For $d=0,1$, let

$$h(q,b)=2q+b+2,\quad \mathcal{S}_d=\{u_j:d_j=d,\ 0\le j<430\},$$
$$r_{d,q}=205-199d+|\mathcal{S}_d\cap\{0,\dots,q-1\}|.$$

An interval ending at -1 is empty. The table defines t_i for $0\le i\le 941$; all index ranges are fixed:

index i	tile $t_i=(w_i,n_i,p_i,s_i)$
0	$(2,435,3,1)$
$j+1$ $(j=2q+b<430)$	$((1-d_j)r_{0,u_j},h(q,b),d_jr_{1,u_j},v_j)$
$433-2a+b$ $(a,b=0,1)$	$(0,432a+b,0,432a+b)$
$\substack{423+2r_{d,q}+b\\ q\in\mathcal{S}_d,\ d,b=0,1}$	$(dr_{d,q},b,(1-d)r_{d,q},h(q,b))$
$923+2a+b$ $(a,b=0,1)$	$(0,432a+b,0,438)$
927	$(2,434,2,0)$
928	$(3,436,4,4)$
929	$(4,436,4,0)$
$496+t$ $(t=434,435,436)$	$(1,438,1,t)$
$933+3a+b$ $(a,b=0,1,2)$	$(a^2,437,b,437)$

A closed decoder for the 430 actions. Put $D_b(A,k)=\left\lfloor A/b^k\right\rfloor \bmod b$, where $a \bmod b = a-b\lfloor a/b\rfloor$. For $0\le q<215$, $b=0,1$, $j=2q+b$:

$$\mathcal{N}=\mathcal{A}\bmod 2^{636},\quad \mathcal{T}=\left\lfloor\mathcal{A}/2^{636}\right\rfloor,$$
$$\nu_j=D_2(\mathcal{N},j),\quad \kappa_j=(\sigma_j+2)^{1-\nu_j}\quad(0\le j<430),$$
$$\sigma_j=\sum_{k=0}^{j-1}\nu_k,\quad \Pi_j=\prod_{k=0}^{j-1}\kappa_k\quad(0\le j\le 430),$$
$$m_q=D_2(\mathcal{N},430+q),\quad \tau_q=\sum_{k=0}^{q-1}m_k,$$
$$F_q=14+m_q(D_{16}(\lfloor\mathcal{T}/\Pi_{430}\rfloor,\tau_q)-14),$$
$$u_j=(\sigma_{j+1}-(\lfloor\mathcal{T}/\Pi_j\rfloor \bmod \kappa_j)) \bmod 216,$$
$$v_j=D_2(F_q,2b),\quad d_j=D_2(F_q,2b+1).$$

Empty sums/products are 0/1. Here $(v_0,d_0,u_0)=(1,1,1)$; the constructor tile uses this actual first target, including its state renaming.

The integer $\mathcal{A}$ in base 10. Its complete decimal expansion is the concatenation of these lines:

```

The fixed integer $\mathcal{A}$ above is written in base 10. Lean proves that the formalized equation has no positive solution exactly when the chosen arithmetized ZFC consistency statement holds, by a derivation in the specified intuitionistic PRA. The literal endpoint was independently replayed on a fixed source snapshot; some transitive dependencies remain inherited. The exact degree is certified by integer-polynomial calculations; the 145-operation count is for the unshifted circuit. Neither count is a minimality claim.

Exact 145-operation circuit

Each numbered line defines one gate over the integers. The inputs are the thirty-five unknowns and the four fixed integers above. The ASCII names `alpha, xi, eta, zeta, upsilon, gamma, vartheta, psi, varphi, epsilon, beta, mu, omega, ell, Delta, delta, kappa, lambda, sigma, tau, chi, theta, nu` refer to their displayed counterparts; `g` is the unknown g. The last gate is zero exactly when the displayed equation holds. The circuit inputs `cNamed, ellNamed` are c, ℓ; gate `a` is the displayed abbreviation; gate `WNamed` is the displayed W, while gate `W` is $C(X + Kq) - Fq$. The inputs `m, n, p, j, d, o, e, z, delta` are the displayed $m, n, p, j, d, o, e, z, \delta$; `kappa, lambda, tau, chi, theta, Q` are $\kappa, \lambda, \tau, \chi, \theta, Q$. Gates `q3, g55, g39, y2, g80` compute $s, x, \sigma, \nu, \vartheta$. Gates `E, I` compute XY, ng; the display uses $E = \lambda$, $I = \theta$. Intermediate gate names below are local abbreviations, not additional unknowns.

```
1.  b = J * beta
2.  q = 1 + b
3.  q2 = q * q
4.  q3 = q * kappa
5.  U = Y * kappa
6.  qF = q - F
7.  C = qF - alpha
8.  E = X * Y
9.  k = eta + zeta
10.  kY = Y * k
11.  c = eta + kY
12.  c2 = cNamed * cNamed
13.  a = lambda + Y
